

Estarahat– A Tele-Mental-Health Application

Primary Purpose

A Flutter-based application for psychological consultations and remote therapy. It connects therapists with patients through video sessions and chat.

Target Users

1. Therapists / Psychologists

They can:

- Create a professional account and manage their profile
- Set working hours and available time slots
- Manage bookings and appointments
- Conduct video therapy sessions
- Communicate through chat
- Track revenue and earnings
- Manage withdrawals to bank accounts
- Manage days off (vacations)

2. Patients / Users

They can:

- Search for therapists by specialty or issue
- View therapist profiles and ratings
- Book therapy sessions
- Pay online (Stripe and Bankily)
- Attending video sessions
- Communicating with the therapist through chat
- View medical records and reports

Main Features

Video Calls

- Live video calls using Agora RTC Engine
- Incoming call screen
- Supports audio and video calls

Chat System

- Direct chat between therapist and patient
- Sending images and videos
- Full-screen image viewer

Payment System

- Payment via Stripe (credit cards)
- Payment via Bankily (local payment method)
- Discount coupons
- Detailed invoices (Tax, Service Fees, Total)

Appointment Management

- Book appointments with date and time selection
- Calendar system
- Therapists manage their available time
- View upcoming and past appointments

Notifications

- Firebase Cloud Messaging (FCM)
- Appointment notifications
- New message notifications
- Incoming call notifications

Multilingual Support

- Supports Arabic, English, and French
- Fonts: Roboto (English), NotoKufiArabic (Arabic)

Therapist Dashboard

- View upcoming appointments
- Income statistics
- Earnings reports
- Subscription management

Security & Privacy

- Firebase Authentication
- Google Sign-In
- Password reset
- OTP verification

Additional Services

- Google Maps to display nearby therapist
- Trending / most requested therapists
- Search by specialty
- Ratings and reviews system
- PDF file viewer
- Local data storage using GetStorage

Technologies Used

Backend / Database

- Supabase
- Firebase (Authentication, Firestore, Realtime Database, FCM, Crashlytics)

State Management

- GetX

Other Technologies

- Stripe for payments
- Google Maps
- Clarity Analytics
- PDF Viewer

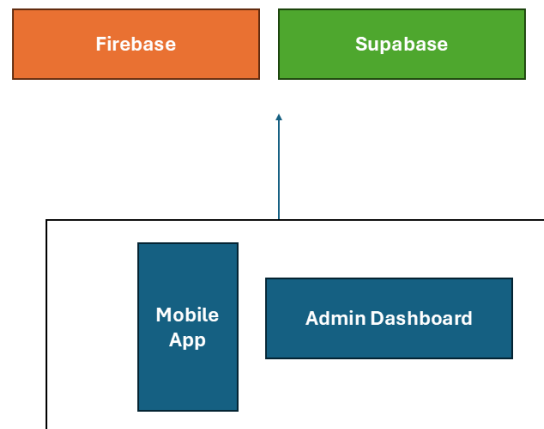

Observed Issues So Far

1. Some screens are duplicated, such as the splash screen and onboarding screen.
2. Padding problems on some screens when switching to French or sometimes Arabic.
3. Buttons are positioned under the Android back button on some devices.
4. Some images are missing from the asset folder.
5. All keys should be stored in the backend. Currently Stripe keys can be exposed through reverse engineering.
6. **CRLF Injection** vulnerability due to an issue in the Dio plugin version — it must be updated.
7. French language layout is broken on some screens.
8. Email Sent from noreply
9. The payments screen should be fixed

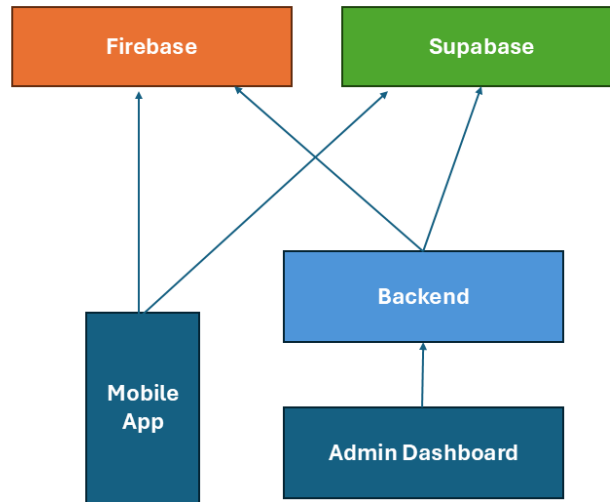

What will be Done

- Build a backend for the admin dashboard instead of making the front end connect with the database directly and make the backend ready to connect to the backend and change the database solutions to reduce cost.

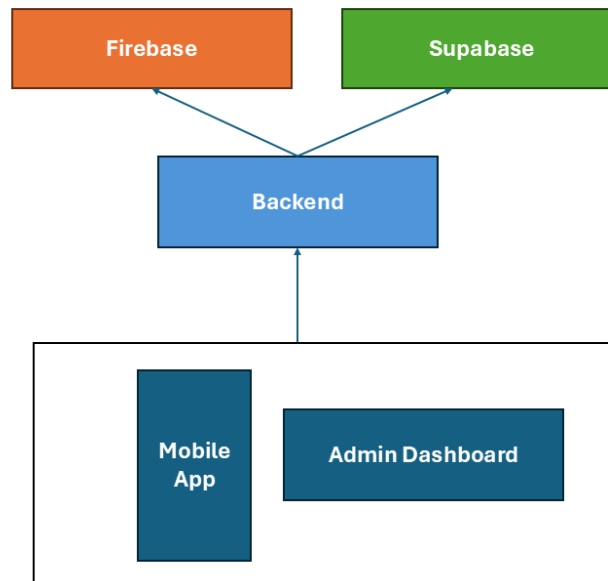

Current Stage:

Next Stage:

What should be Done

- In this case errors will be handled successfully and in a better way.
- More efficient in running the application and the admin panel.
- In the future supabase could be neglected and handle our database locally.
- Design a new admin panel to control the app events and actions.
- Fix the error in the mobile app.
- Make the app ready for production and have test phases to make sure that everything is working.
- The backend will be designed in ExpressJs as a common language to reach the support
- The source code of the project will be provided in every stage of development.
- The admin panel front end side will be developed by reactjs
- Every issue in the app will be handled without any new features.

Our Plan to fix all this

Development Stage – **45-60 days**.

- Fix all the bugs and make the app ready to the deployment stage
- Test the app flow to make sure that everything is functional and ready to go based on the observed issues.
- Design the admin panel
- Build the backend
- It will cost **900\$**

Deployment stage - **3 to 4 weeks**:

- The app will be available on Play store tested with **15 android devices** to reach the production stage.
- The app will be available on Apple store to be available for all the Apple devices.
- This will cost **200\$** without the fees of the android developer account and the apple developer account.

Installations and stages of payments

Development Stage:

- 300\$ Deposit
- 300\$ When admin panel is finished
- 300\$ When the backend is ready and deployed.

Deployment Stage:

- 100\$ When uploaded on play store
- 100\$ When uploaded on Apple Store

What we also offer:

- 2 months of free consultations and support for the backend and app handling.
- 2 months of free entrepreneurship consultation and guidance for market penetration.
- 1500\$ Annually, quarterly paid for renewing the consultation and the full tech support of the app with max **10h** a month.
